## 1 Data: BLP

[\[Go to ToC\]](#)

- After comparing datasets downloaded from BLP on Mar 2018 and Feb 2019: BLP updated values (slightly) in variables starting on: 9/30/2009 (USSW), 5/4/11 (USBC, USBA).

- ☐ EUBS1-EUBS20 for PLN deleted since already downloaded for HUF.
- ☐ Check PZSW\*V3 Curncy against PZSW\* Curncy for PLN because the former have a shorter history (became active in 2013 vs 2000). Why the substitution? Was it because PZSW\* Curncy were discontinued?
- ☐ Download PZSW15 and Curncy PZSW20 to complement the history 6/12/2000-1/30/2013 for Curncy PZSW15V3 Curncy and PZSW20V3 Curncy, respectively.
- ☐ Check MRBS\* starting in 4/20/2016 because in the data downloaded in 2019 they were flat most of the time after that date.
- ☐ Check the following series b/c they remain mostly flat during those periods: SABS15 Curncy b/w 4/15/2014-1/27/2016, SABS20 Curncy b/w 4/15/2014-8/28/2015, SABS25 Curncy b/w 1/3/2000-9/5/2011, SABS30 Curncy b/w 1/3/2000-5/10/2010.
- ☐ Check constant yield curves.
  - ☐ NOK: C26610Y Index is flat after Nov 2012, C26610Y is flat twice during the sample.
  - ☐ PHP: Since 29-Oct-2018 BFV data does not vary. In the dataset, the BFV series includes IYC (converted into CE par) yields since 1-Oct-2018. Update BFV series w/ BLP data when access to it is available.
- ☐ Include variables in datasets: CDS, longest histories in consumption and inflation for EMS. Same macro-financial data for AEs than for EMs?

## 2 Datasets: Daily

[\[Go to ToC\]](#)

- ☐ For BRL RHO 2Y deviates from DIS starting in 2016. RHO 7Y is not available relative to DIS.
- ☐ For GBP RHO 7Y increases a lot relative to DIS in 2010.
- ☐ For PEN RHO 7Y big decrease in 2018.
- ☐ For PHP RHO 7Y big spike in 2010.
- ☐ For THB, AUD, CHF, DKK, EUR, NZD, SEK RHO 7Y and CAD 3Y, 7Y big declines.
- ☐ Review RHO:
  - ☐ COP 1Y flat b/w 2012-2015.
  - ☐ HUF 3M.
  - ☐ IDR 1Y.
  - ☐ ILS 3M, 7Y.
  - ☐ MYR 2Y.
- ☒ For NOK RHO 2Y, 3Y, 7Y have a hole in 2008-2009. Reason: cutoff date of convention to compute IRS.

### 3 Data: Codes

- ☐ Consider shorter histories of some series within a country.
  - ☐ For PLN consider removing PZBSEC6 Curncy, PZBSEC8 Curncy, PZBSEC9 Curncy (and PZSW6V3 Curncy, PZSW8V3 Curncy, PZSW9V3 Curncy) because they start in 2011 and that seems to eliminate the data before 2011 for PLN even if it is available for all the other tenors; plus it may not be needed, it depends on the other variables in the formula having the 6Y tenor available. Or modify the code so that those tenors are considered once they become available (and discarded before 2011).
  - ☐ Availability of data for PZBSEC6 Curncy and PZSW15 and Curncy might be related to the history of the synthetic curves for PLN.
  - ☐ Check that the shorter history of PZSW15V3 Curncy and PZSW20V3 Curncy (starts in 2013) does not affect the history of the synthetic curves for PLN.
  - ☐ Check that MRBS10 and lower start around 2005, while MRBS15 around 2007 and MRBS20 in mid-2009.
  - ☐ RRUSW10 and lower start in 2006, while RRUSW15 and RRUSW20 in 2009.
  - ☐ TBSWNI10 and lower start in 2007, TBSWNI15 and TBSWNI20 in 2009.
- ☒ In compute\_fp\_long.m address cases for HUF, PLN and NOK. If BS (HUF, PLN) and IRS (NOK) series are NaN, use zeros.
- ☒ There are countries with BFV and IYC curves, transform BFV into ZC yields and compare the curves. BFV has CE par yields, IYC has CE ZC yields. Need to be converted into ZC continuously compounding.
- ☒ For countries for which DIS have a longer history than me, check whether it is b/c we use different LC YC (BFV vs. IYC) and one has a longer history. For HUF and PLN is b/c BS series start in 2007 in my sample.
- ☒ Update codes since EUBS1-EUBS20 for HUF and PLN were deleted because they were already downloaded for EUR (plus EUBS25 and EUBS30 are now included).

[\[Go to ToC\]](#)

### 4 Data: Files

- ☒ In the dataset, the BFV series for PHP includes IYC (converted into CE par) yields since 1-Oct-2018.
- ☒ In CE\_Forecasts.xlsx, input first CPI 10Y forecast for PHP equal to next value since original value is unrealistically low.
- ☒ In AE\_EM\_Curves\_Tickers.xlsx change cutoff date for NOK. Official date 9/2/2008 only applies to 1Y, 5Y and 10Y tenors. New date 5/20/2009 applies to all tenors.

- ✓ Data: CRSP.
  - ✓ Download “Riskfree Series (1-month and 3-month)”, “Riskfree Series (4, 13, and 26-week)”, Fama Term Structure data for 3- 6- 9- months. Compare them.
  - ✓ Update read\_usyc.m to read CRSP data for maturities < 1Y.
  - ✓ Compare results in LC spread and forward premium for 3M against DIS.
- ✓ It seems that EUBS1-EUBS20 for HUF can be deleted from AE\_EM\_Curves\_BDH.xlsx (codes referencing BS\_EUR so far —fltr4tickers and compute\_fp\_long— updated). Need consistency because the Type column in sheet Identifiers is different for HUF (BS\_EUR) than for EUR (BS).
  - ✓ Compare time series of EUBS1-EUBS20 for HUF and for EUR to make sure they are the same (i.e. downloaded correctly).
  - ✓ Highlight in red columns DM-DV in original Zero\_Swap\_Curves\_Bloomberg.xlsx to indicate that those tickers were removed in current dataset.
  - ✓ Comment after comparison: small differences between 2018 and 2019. No change was made to 2019 series. Same data when comparing EUBS1-EUBS20 for HUF and EUR.
  - ✓ Delete BS\_EUR in Type column in README sheet in AE\_EM\_Curves\_Tickers.xlsx. Update Type columns in HUF and PLN sheets for EUBS1-EUBS20 from BS\_EUR to BS.
  - ✓ Update AE\_EM\_Curves\_BDH.xlsx.
- ✓ Change name of files to US\_Yield\_Curve\_Data.xlsx, IMF\_Country\_Codes.xlsx, ISO\_-Currency\_Codes.xlsx, BIS\_CB\_Policy\_rates.xlsx, CIP\_Data.xlsx and CIP\_data.dta (original\_ removed).
- ✓ Value for PHP CPI 10Y changed from 1.3 to 4.8 since it is unrealistically low.
- ✓ Update CE\_Forecasts.xlsx: change order of groups (APCF, LACF, EECF), correct dates for EECF.
- ✓ Delete EUBS1-EUBS20 for PLN in both sheets (All, Tickers) of AE\_EM\_Curves\_-BDH.xlsx.

## 5 Codes

[\[Go to ToC\]](#)

- Check if the formula for the CCS of HUF needs to be updated in compute\_fp\_long.m as indicated in the AE\_EM\_Curves\_Tickers.xlsx file (check the sign —plus or minus— for TBS6v3).
- ✓ Updates to Kfs: remove commented nargin for mu\_x and mu\_y.

- ✓ Move loadings4ylds to the temp folder.
- ✓ Update loadings4ylds: help, round maturities so that input as [0.25 1:5:10]
- ✓ Consider to include files as subfunctions.
  - ✓ findNaN.m into remove\_NaNcols.m.
  - ✗ matchtnrs.m into extract\_vars.m. extract\_vars.m is already long.
  - ✗ fltr4tickers.m into extract\_vars.m. Filter also used by compare\_ycs.m and zc\_yields.m.
  - ✗ y\_NS into y\_NSS.m. They are used separately by zc\_yields.m.
- ✓ Add read\_cip.m and iso2names.m in m-files called in read\_data.m.
- ✓ Move old codes to Aux-;Temp folder.
- ✗ Check what the mat-files (ccs\_data.mat, ccs\_info.mat) contain to decide whether to move them to the Aux folder. Obtained with old codes.
- ✓ Filter SPT in THdt to see if the currency tickers are identified. Yes, actually curncs is now obtained directly from the headers table.

## 6 Facts

[\[Go to ToC\]](#)

- No EM was at the ZLB over the period.
- Countries w/ LCNOM YCs of less than 10Y maturities:
  - IDR b/w 25-Feb-2003 and 15-Apr-2003 max tenor was 8Y.
  - KOR b/w 3-Jan-2000 and 30-Oct-2000 max tenor was 8Y.
  - RUB b/w 04-Apr-2006 and 19-Jun-2007 max tenor was 7Y.
  - TRY b/w 17-Feb-2005 and 22-Feb-2005 max tenor was 3Y.
  - TRY b/w 22-Feb-2005 and 28-Jun-2010 max tenor was 5Y.
- Advantage of LCSYNT (longer history) instead of LCNOM for: BRL, IDR, PHP, RUB, TRY. Disadvantage for COP, HUF, ILS, MXN, MYR, PEN, PLN, THB, ZAR.
- Since 2016, CHF and DKK negative YC up to 10Y and 7Y, respectively. Before GFC, close to ZLB.

## 7 Tables

- ☐ Clean Tables folder.
- ☐ Upward sloping YCs? Averages.
- ☐ Compare TPsynt in EMs vs TPnom in AEs. Averages. Compare to current table 2. Compare w/ average YC slope.
- ☐ Fit. RMSE. Averages per country. Nominal AEs and synthetic EMs (incl. ILS and ZAR).
- ☐ Compare TPs w/ empirical measures as in Curcucu et al. 2018. Compare against survey-based TP, and measures of risk and uncertainty.
- ☐ Compare ssb\_yP vs CBP surveys. Similar to comparing against model-free TPsvy. Comment this in footnote.
- ☐ Decompose nominal yields. Averages per country. Averages before and after the GFC to see if relative importance of the components changed. Drivers of yields: Average and std of components (TPsynt, LCCS and yE).
- ☐ Feeling of data. Summary statistics of yield (Guimaraes) and survey data (inflation, GDP, short rate).
- ☐ Term structure of TP. Averages per country.
- ☐ Correlation of BRP and TPnom. Averages of components (relative importance) per country. Before and after the GFC.
- ☐ Compare std of BRP vs std of AE TP. C-R (2002): risk premiums are far more volatile in emerging markets than in developed economies. Bech and Lengwiler (2011) find that central bank purchases of bonds not only reduced long-term interest rates, but also led to lower interest rate volatility.
- ☐ t-test for  $LCCS = 0$  and  $TPsynt = 0$ .  $LCCS = 0$  is equivalent to test  $TPnom = TPsynt$ .
- ☐ Average and std of real interest rate to see if on average is the same across EMs and how much variability it has compared to nominal and synthetic yields. Correlation b/w real rates of EMs.
- ☐ Notes for tables.

## 8 Research Questions

- ☐ Why TPs differ across EMs? Average of TPsynt per country, is there a large variation among them? b/w them and AEs?
- ☐ Why TP and CR move as they do? Which asset pricing model is consistent with the data (TP, CR)? What explanations of bond risk premia are supported? Compensation for disagreement (increases quantity of risk), for economic pain (increases price of risk), for economic uncertainty about GDP growth and/or inflation (increases price of risk), for volatility risk (increases quantity of risk)?
- ☐ High inflation uncertainty leads to high TP?
- ☐ Has the importance of TP and CR changed after the GR? More role of CR after the GR since large fiscal debts?
- ☐ Did UMP spread abroad? He and McCauley (2013) and Turner (2014). QE's purpose was to decrease TP in AE, did the same happen to EMs?  $TP < 0$ ?
- ☐ Why  $TP < 0$ ? Change in importance of AD relative to AS shocks? Change in correlation b/w consumption and inflation and b/w bonds and stocks (so bonds become hedges of stocks)? Gourio and Ngo (2016), Pericoli (2018), Campbell, Pflueger and Viceira (2018), Campbell, Sunderam and Viceira (2016). Or financial integration story?
- ☐ Financial integration: Correlation b/w debt flows from TIC data and TP. FX reserves. The increase in inflows reflected in an increase in FX reserves, lower bond yields or both. Case of capital controls in Brazil.
- ☐ GFCy is different at the short than at the long end of the curve. Obstfeld (2015)
- ☐ Is there a risk channel for monetary policy spillovers? Are LT rates more highly correlated than ST rates? Policy rate disconnect for ST and/or LT? US spillovers work through changes in risk premia? Expected rate in EMs react to changes in USTP?
- ☐ International comparisons of expectations (yE). Subtract inflation expectations and see whether  $r^*$  differs. Is there a single world real interest rate? Is the real interest rate the same for all EMs? Plot min-max intervals to see spread like Kalemli-Ozcan for policy rates.
- ☐ What is the relationship b/w the YC components and the forward premium?
- ☐ Decompose the forward exchange premium into: an expectations part and a risk premium. Clarida-Taylor (1997), Burnside et al (2007), Backus et al (1995). If LT TP are more closely linked, then  $\tau_{\rho}$  is closer to zero and thus UIP holds more closely for LT rates than for shorter ones.
- ☒ TPs across EMs: Are they idiosyncratic or is there a common factor driving them? PCA for all yields. PCA for ST rates. PCA for LT rates. No common component might imply segmented markets, capital controls, home bias.

## 9 Analysis: Short Term

- ☐ Compare monthly w/ daily fit and decompositions.
- ☐ Read US MPS. Read Eberly, Stock and Wright.
- ☐ Create dataset for Stata analysis.
- ☐ Analysis on spillovers: Responses of EM components to US MPS (regressions as in Curcuru or panel local projections as in ACDM); lags in response; asymmetric effects on different parts of the YC; changes in components around QE-TT announcements; local events.
- ☐ Reorient paper based on results.
- ☐ Schedule: codes (ts\_\*), figures (ts\_plots), tables (ts\_tables), export dataset as dta, do-file w/ basic analysis, re-estimate the model w/ monthly data after all changes in codes (RMSE, matsout, i\_survey etc.) and update figures-tables-dta-do, estimate the model w/ daily data (assess fit and test against results w/ monthly data), event study analysis.

## 10 Analysis: Medium Term

- ☐ Estimate Guimaraes w/ daily data for US and compare against KW.
- ☐ Check whether functions in post-estimation analysis need to be updated after the bsl field added to the structure.
- ☐ Check whether usyc\_analysis.m (done before atsm\_estimation.m), compare\_pcs.m (when unbalanced panels were thought to be used) and compare\_atsm\_surveys.m (predates ts\_\* post-estimation functions) need to be moved to Temp folder.
- ☐ Construct panel dataset to analyze results in Stata. Include: rho, CIPdev, svys (CBP, INF, GDP), LCNOM, LCSYNT, decompositions (yQ, yP, tp), macro-financial (US, CBP, STX, FX), EPU. Before dataset, construct a field with yQ, yP, tp for ALL countries (EMs/AEs), ssb for EM w/ surveys, sy for ILS and ZAR, ny for AEs. Same tenors (0.25-10Y).
- ☐ Drivers (monthly): Panel regressions for TP, LCCS, yE for AEs and EMs. Currently, no macro data for AEs.
- ☐ Spillovers (event study): Panel regressions for TP, LCCS, yE for AEs and EMs.
- ☐ Annex for some descriptive tables and figures.

## 11 Analysis: Long Term

- ☐ Allocate 6-10 surveys to 5-10 forward rate instead of the 10Y yield.
- ☐ Prepare dataset to estimate `i_survey` using panel data instead of individually.
- ☐ Re-estimate parameters after 0.25 and 0.5 in `matsout`, `RHO` in `S`.
- ☐ Update all functions after `daily2monthly` (`forecast_cbpol.m`, `append_surveys.m`, `atasm_estimation.m`, `assess_fit.m`) after datasets renamed from `c_`, `n_`, `s_` to `mc_`, `mn_`, `ms_`. After that, move `daily2monthly` to Temp folder and use `daily2dymy.m`.
- ☐ Potential solution to TP in AEs not being negative is likely due to using the PCs from `jszLLK_KF` (instead of PCs not smoothed).
- ☐ Download EPU indexes for AEs to see how it correlates w/ AE TPnom.
- ☐ Mention characteristics of sample: MYR doesn't have an IT regime but similar characteristics (Pennings et al. 2015).
- ☐ Use 0.25 and 0.5 Y to test results from forward premium puzzle. Whether it holds at short but not at long maturities (Lingareddy 2008).
- ☐ Compare my TPMX against Blake et al. Both TP nom and TPsynt.
- ☐ ATSM estimated with longer series for AEs.
- ☐ Replicate the analysis in Dahlquist & Hasseltoft on time-varying bond risk premia.
- ☐ Structure for the US YC. In `daily2monthly` for US extract LCNOM, OIS, FF. Add Guimaraes TP.
- ☐ Hamilton 'Measuring global economic activity' or Kilian (<https://sites.google.com/site/lkilian2019/re-sets>) for GFCy and C-P global factor.
- ☐ Stock and Watson inflation decomposition. Follow Wright 2011.
- ☐ Discuss insights of yield decompositions. Wright 2011 description. Adrian 2017 description. Sack 2008 description. Read KW 2005 explanations for declining TP < – > Episodes of negative TP per country < – > Portfolio inflows < – > Taper tantrum. Correlation w/ inflation, changing  $\pi^*$ : do surveys help w/ this; is high inflation a risk factor. LCCS properties in D-S. Hoffman-Shim-Shin. Financial integration. Russia case discussed in D-S: can the 3-part decomposition shed light?
- ☐ Save figures to be used in pdf.
- ☐ Prepare slides.
- ☐ Correct US YC for credit risk (Chernov, Schmidt, Song).

- ☐ Repeat analysis using dataset of Wu (competes against GSW) to see how sensitive the results are to using GSW.
- ☐ Replicate Lloyd.
- ☐ Check whether the removal of CB governors in TRY had an effect on its TP. Did TP decline in countries that adopted IT during the sample period? Need to know when it was announced (not when IT started).

## 12 Analysis: Completed

[\[Go to ToC\]](#)

- ☒ Clean Analysis folder (rp-\*).
- ☒ Transform script for daily fit into a function.
- ☒ Estimate model for daily data to study the effect of QE announcements and local events. Follow ACM (2013) to estimate and assess fit for daily yields - Use OLS. Prepare a new S structure to store the results - no need for new S.
- ☒ Compare PCs from *pca* to smoothed state xs. They are not equal.
- ☒ Add daily datasets to structure S.
- ☒ Eliminate yields in month after US end-of-month date. Not necessary, once parameters are estimated, only need yields observed.
- ☒ Add 0.25 and 0.5 to *matsout*.
- ☒ Add RHO to *daily2monthly*. In *VarType* and in the *switch* loop. Check whether in *fields* too.
- ☒ Function to calculate RMSE. Not included in *estimation\** b/c it will be used after estimation w/ daily data.
- ☒ Fields in structure for baseline estimations for all countries (ssb for EM, sy for ILS and ZAR, ny for AEs).
- ☒ Codes: move all parts in *ts\_plots* that add variables to S into a function that can be called by *ts\_analysis*. Leave only code for plotting in *ts\_plots*.
  - ☒ Update *forecast\_cbp.m* and *append\_surveys.m* to use new field name (*svycbp*).
  - ☒ Split *ts\_plots* into functions: *plots*: correlations, *pca*.
  - ☒ Call all functions from *ts\_analysis*.
  - ☒ Take functions *datesmnmx* and *syncdtst* outside of *ts\_plots* and test.
  - ☒ Create *add\_vars* function.

- ✓ After estimation, add fields to structure S: macro vars, svys, brp, epu, realrt. Needed for plots and tables.
- ✓ Save surveys in S as: svyinf, svygdg, svycbp. All maturities.
- ✓ Add policy rates data to macro data in structure of all countries.
- ✓ Rename section 4 from Results to Yield Curve Decompositions. Section 5 would then addressed international spillovers.
- ✓ Mention explicitly that 3 factors b/c they explain more than 99% of the variation in yields.
- ✓ US factor + non-US factor in each one or only in some of them?
- ✓ Download USTP01 USTP10, USYP01, USYP10 from KW, and construct USyP.
- ✓ TP correlations of AEs with: USTP, Vix, CIPdev.
- ✓ PCA for TPsynt, LCCS and expectations. Common factor, commonalities (TPs, yP, LCCS) all, ST vs LT. Not real rates b/c dates don't match.
- ✓ PCA for yields synthetic and nominal. Variability explained by PC1-PC3.
- ✓ Correlations of LCNOM components w/ alternative measures. Similar to Table 1 in Curcucu et al (2018).
- ✓ Plot TP vs LCCS, USTP, Vix, EPU, local inflation. Not debt flows from TIC b/c no data yet.
- ✓ TP correlations of EMs with: USTP, Vix, EPU index, LCCS, local inflation. Previous odd results w/ correlations might be explained by differences in estimated TPs. Use figure ssb\_ny\_tp.eps.
- ✓ Plot inflation vs 10Y yield. They tend to move together.
- ✓ Compare TP of Guimaraes vs KW. Add QE-TT dates. Compare USTP against TP in AEs and EMs.
- ✓ Plot TPsynt vs TPsvy. TPsynt follows TPsvy closely.
- ✓ Drivers of yields. Compare TPsynt, LCCS and yE against nominal yield to see drivers of EM yields.
- ✓ Bond risk premia. Compare TPnom vs TPsynt+LCCS. Construct BRP series. Plot its components. Compare against TPnom.
- ✓ Term structure of TP. Averages per country. QE events added.
- ✓ function for synchronizing series.

- ✓ Compare  $y_{\text{Esynt}}$  and  $y_{\text{Enom}}$  (w/ and w/o surveys) to see if they are similar. If so, it supports  $TP_{\text{nom}} = TP_{\text{synt}} + LCCS$  -  $\hat{\epsilon}$ . TP and RP are not the same thing for EMs. Hypothesis:  $y_{\text{Esynt}}$  and  $y_{\text{Enom}}$  closer w/ surveys. Won't: Compare when  $sgmS$  free vs fixed.
- ✓ Feeling of fit. Compare  $y_{\text{lds}}$  vs  $y_{\text{Q}}$ . They are very close for most countries.
- ✓ Plot LT real interest rates =  $ssb\_yP$  - INF surveys. Are LT real rates similar? It seems that for most countries it fluctuates b/w 0 and 1 pp.
- ✓ Plot  $yP$  for EMs and AEs. Is there a trend? No a marked one.
- ✓ Plot  $ssb\_yP$  vs CBP surveys.
- ✓ Compare  $TP_{\text{synt}}$  in EMs vs  $TP_{\text{nom}}$  in AEs. Declining trend more marked for AEs, in EMs  $TP \downarrow 0$ .
- ✓ Compare  $TP_{\text{nom}}$  vs  $TP_{\text{synt}}$  for AEs. How big is the difference? Similar for most. Differences for AUD, NZD, SEK.
- ✓ Plot  $TP_{\text{nom}}$  for AEs. Trends? Declining.
- ✓ Analyze TP synt.
- ✓ TP for AEs. Reaction to QE events.
- ✓ Compare TP different versions: nominal vs synthetic,  $y_{\text{lds}}$  only vs surveys,  $sgmS$  free vs fixed.
- ✓ Plot TP different versions individually. Add key dates when plotting TPs: target adopted/changed, QE announcements, local events (capital controls).
- ✓ Plot: inflation, policy rate, expectations of inflation.
- ✓ Plot survey forecasts of inflation. See whether there is a trend. For some countries.
- ✓ Read old version of results.
- ✓ Review old code in Analysis folder.
- ✓ Estimate ATSM for AEs and EMs. Save TP w/ JSZ and w/ surveys for LCNOM and LCSYNT.
- ✓ After estimating ATSM, generate yields (P, Q) and TP for ALL maturities to get balanced panels (output tenors vs input tenors). Only report 1Y, 5Y, 10Y tenors in all cases.
- ✓ Make sure all monthly data (yields, surveys, macro) has SAME end-of-month dates.

- ☒ Add als in pca to be able to estimate JSZ for initial values. Need balanced panel to use JSZ.
- ☒ Generate dataset w/o fitting NS to YCs.
- ☒ Replicate Guimaraes but w/o including the survey maturity for 10Y to see how much that maturity helps pinning down the parameters of the model. It helps a lot, especially with shorter samples.
- ☒ Explicit that longer series for AEs and surveys for EMs. Also, no surveys for AEs for comparison w/ other studies.
- ☒ Decompose US YC.
- ☒ Use surveys to decompose US YC and compare to Guimaraes.
- ☒ Look for ST expectations in CE for EMs to complement LT ones.

## 13 Literature
